The methodology IIIB is applicable for fuel switching only, how project proponent can claim for waste heat recovery and energy efficiency projects under this methodology.

how the project proponent can combine various activities with different technologies under one PDD without bundling.

switching over from diesel to natural gas is common practice in Madhya Pradesh, India as gas authority of India Limited has laid gas pipe line throughout the region. hence, how the project is additional?

The PDD is developed for two units located at Madhya Pradesh and Haryana in a single PDD. Even if both plants are using same technology, the project should be bundled. No bundle form is attached.

Both plants are not using same technology and hence, separate PDD to be developed

For waste heat recovery, the methodology applied III B, how it is justified

Only single PDD developed for two plants, does not require separate PDD's

For waste heat recovery, the methodology applied is fuel switching, Justify
