1. The PDD does not specify the existing swine manure collection method. The value of MS%(BL)100% suggests that the manure and urine are flushed and go to the lagoon together. In many swine farms, the manure is collected manually and stored for land application. It is good to clearly describe the manure collection method of the swine farms in the PDD.

2. It is stated that 'the VS reduction in the solid separation process is 10%'. But according to common sense, most of VS is removed in the solid separation process and only a small portion of VS remains in the liquid to be treated by the anaerobic digesters. Therefore 10% is questionable.
