We cannot reproduce the calculated CERs using the 1st order decay model as given in AM0025.

Even though the k factor for corn stalk has not been disclosed (bottom of p42) we do not manage to reproduce the calculations for the annual emission reductions. As a matter of fact when we use the 1st order decay model, the amount of credits is average 60,000 vs 262,167 as mentioned in the PDD. Hence more data is required to objectively reproduce/ verify calculations.
